Cryptocurrency Futures New Listing Strategy

Phase 1: Initial Short Position

1. Keep sufficient capital available before the futures listing opens.
2. Allow the market to establish an initial price range after trading begins.
3. Use **Fibonacci Retracement**, **Fibonacci Fan** and **Long Position** levels to identify potential resistance zones.
4. When price rallies into a predefined Fibonacci resistance area and shows signs of rejection, consider opening a short position.
5. Before entering, define:
    - Entry price
    - Profit target(s)
    - Exact conditions for closing the position
6. Place a take-profit order immediately after entry.
7. If price reaches the predefined profit target, close the short position according to the plan.

Phase 2: Long Position After Short Exit

1. After closing the short position, reassess market structure and momentum.
2. Use updated **Fibonacci Retracement**, **Fibonacci Fan** and **Long Position** levels to identify potential support zones.
3. If the market shows signs of support, stabilization, or bullish reversal, consider opening a long position.
4. Before entering the long trade, define:
    - Entry price
    - Profit target(s)
    - Exact conditions for closing the position
5. Place a take-profit order immediately after entry.
6. If price reaches the predefined profit target, close the long position according to the plan.
